Queens College, CUNY, Department of Computer Science
CSCI 212 Lab - Object Oriented Programming in Java
Lab 13

Using the `Employee` / `Manager` hierarchy from Lab 12 and the provided `Payroll` class, write a complete program `PayDemo2.java` that:

- builds an `Employee[]` containing `new Employee("Ana", 52000)`, `new Manager("Bo", 96000, 13000)`, `new Employee("Chen", 65000)`, and `new Manager("Dana", 104000, 26000)`, in that order;
- loops once over the array, printing each employee;
- calls `Payroll.printPay(e)` for every employee;
- for every element that is really a `Manager`, prints an extra line `Bonus: ` followed by that manager's bonus;
- uses `instanceof` and casting where appropriate.

Before running the program, predict its output. After running the program, compare the result with your prediction, and understand the reason for the output.
