Lab 3/4

Customer Ratings

Write a Java program named `Ratings.java` that records customer ratings and summarizes the results.

A customer may give a rating from **1 through 5**.

Your program should:

1. Create an integer array that can store the number of times each rating from 1 through 5 is entered.
2. Repeatedly ask the user to enter a rating.
3. If the user enters a number from **1 through 5**, record the rating.
4. If the user enters **0**, stop reading input.
5. If the user enters any other number, ignore it and continue asking for ratings.
6. After input is complete, print:
    - The number of times each rating was entered;
    - The percentage of all valid ratings represented by that rating;
    - The average rating.
7. Do not print ratings that were never entered.

You may assume that the user enters at least one valid rating.

For example:

```
Enter ratings (1-5, 0 to stop):
5
4
5
3
7
5
0
```

Rating 3: 1 time(s), 20.0%
Rating 4: 1 time(s), 20.0%
Rating 5: 3 time(s), 60.0%
Average Rating: 4.4

Swap the First and Last Characters

Write a complete Java program named `SwapWords.java`.

The program should ask the user to enter a line containing several words. For each word, create a new word in which the **first and last characters are exchanged**.

- A word with only one character should remain unchanged.
- Print all of the modified words in the same order as the original input.
- You may assume that words are separated by a single space.

For example:

Enter some words: Java is very easy
aavJ si yerv yase

Another example:

Enter some words: I like CSCI212
I eikl 2SCI21C
