Queens College, CUNY, Department of Computer Science
CSCI 212 Lab - Object Oriented Programming in Java
Lab 5

Swap Words in a File

Modify the `SwapWords.java` from the previous lab to `SwapFileWords.java` so that it reads text from a file named `words.txt` instead of from the keyboard.

For each word, exchange its first and last characters.

- A word containing only one character should remain unchanged.
- Preserve the order of the words.
- Process every line in the input file.
- **Write the result to a new file named `swapped.txt`.**
- **Close both the input and output files when finished.**

For example, if `words.txt` contains:

Java is very easy
I like CSCI212

Then `swapped.txt` should contain:

aavJ si yerv yase
I eikl 2SCI21C
